Introduction

The proposed project is a centralized web-based platform designed to help university students manage and access academic and campus-related information from a single system. The platform will provide students with access to academic notes, important notices and deadlines, career opportunities, and campus issue reporting. It will also provide an administrative system for managing users and platform activities.

Problem Statement

University students often need to collect academic materials, notices, career opportunities, and other campus-related information from different platforms and communication channels. This makes information difficult to find, organize, and manage efficiently. There is also no centralized system for students to share academic notes, track important deadlines, access career opportunities, and report campus-related issues. Therefore, a centralized platform is needed to organize these services in one accessible system.

Objectives

The main objectives of the project are:

- To create a centralized platform for academic and campus-related information.
- To provide an organized system for sharing, searching, and accessing academic notes.
- To allow students to rate and review shared academic notes.
- To provide important notices, deadlines, and career opportunities in one place.
- To provide a structured system for reporting campus-related issues.
- To provide an administrative dashboard for managing the platform and its users.

Proposed Solution

The proposed system will provide a centralized web-based platform where university students can access and manage academic and campus-related information from a single system. Students will be able to create accounts, manage their profiles, share and access academic notes, rate and review notes, track important notices and deadlines, explore internship, job, and scholarship opportunities, and report campus-related issues. An administrative dashboard will allow authorized administrators to manage users, notes, notices, opportunities, and reported issues.

Key Features

The major features of the proposed system are:

- **Student Registration & Login:** Students can create accounts, log in, and manage their account information.
- **Student Profile:** Students can maintain their department, batch, semester, and relevant activities.
- **Note Sharing:** Students can upload, access, and download academic notes.
- **Search & Filter:** Notes can be searched and filtered by department, course, course code, semester, and topic.
- **Note Rating & Review:** Students can rate and provide reviews for shared notes.
- **Notice & Deadline Tracker:** Important academic notices, events, and deadlines can be published and tracked.
- **Campus Issue Reporting:** Students can report problems related to classrooms, laboratories, and other campus facilities.
- **Internship / Job / Scholarship Board:** Students can find relevant career and educational opportunities.
- **Admin Dashboard:** Administrators can manage users, notes, notices, opportunities, and reported issues.
- **Platform Statistics:** The system can display relevant statistics such as total users, notes, downloads, note reviews, opportunities, and reported issues.

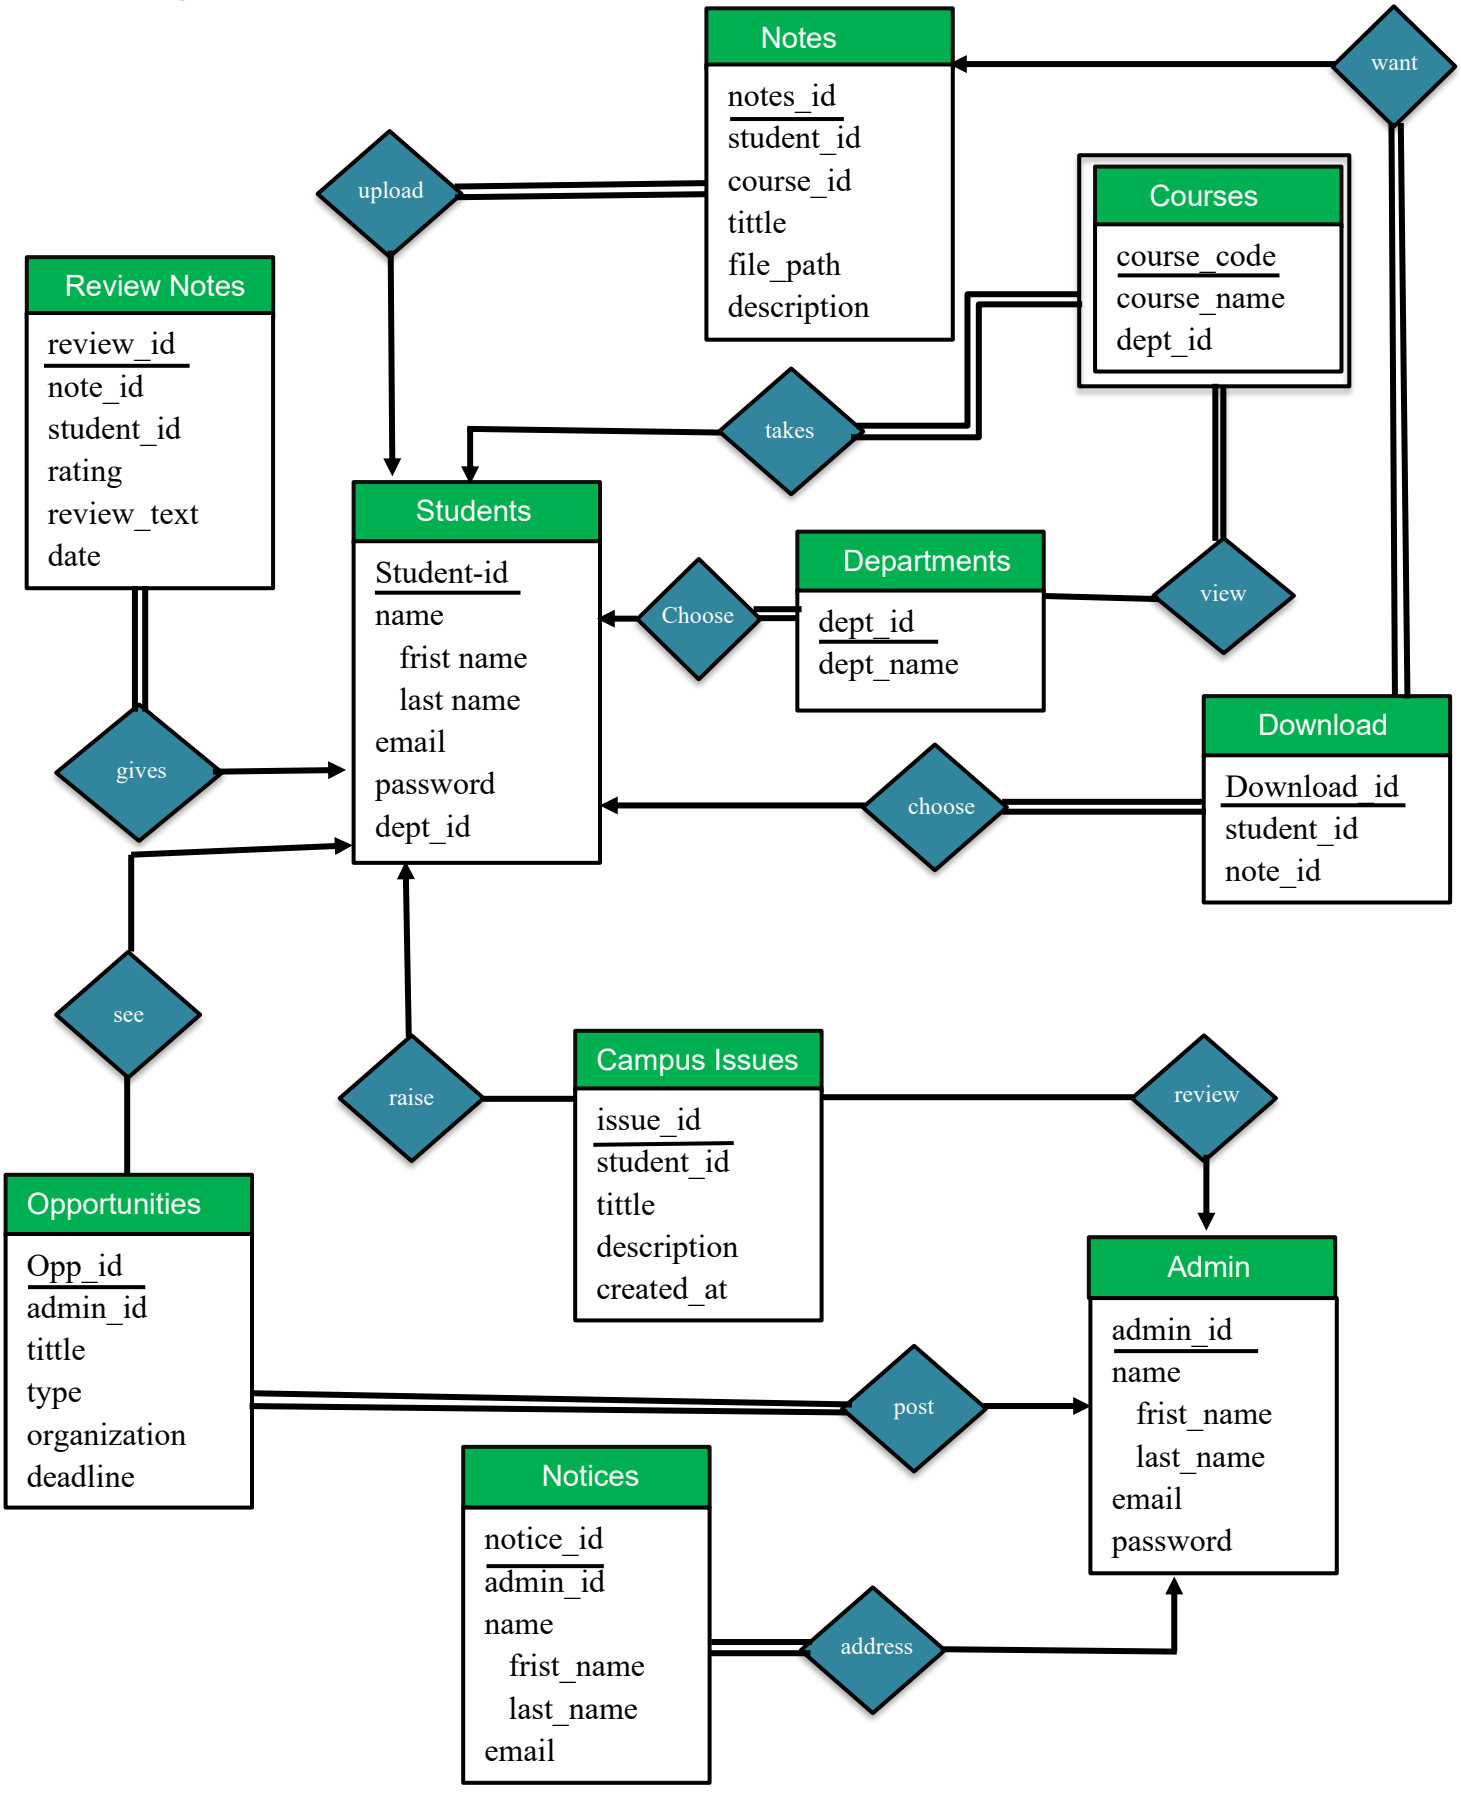

Technology Stack

Component	Technology
Frontend	HTML,CSS
Backend	PHP
Database	MySQL
Database Management	phpMyAdmin
Local Development Server	XAMPP
Code Editor	Visual Studio Code
Version Control	Git & GitHub

System Design & Development Plan

The system will use a web-based architecture where students and administrators interact with the platform through a web interface. PHP will handle the application logic and communication with the MySQL database, while HTML and CSS will be used to develop the user interface.

Development Methodology

Methodology: Waterfall Model

The Waterfall Model will be used because the project requirements are clearly defined. Its sequential development process will help maintain a structured and organized development process.

Development Plan

Phase 1: Requirement Analysis & Planning
Identify system requirements, user roles, and finalize the major features of the proposed system.

Phase 2: System & Database Design
Design the system architecture, ER diagram, database structure, and basic user interface.

Phase 3: System Development
Develop the core modules including authentication, student profiles, note sharing, reviews, notices, opportunities, issue reporting, and admin management.

Phase 4: Testing & Debugging
Test the system functionality, identify errors, and fix bugs to ensure proper system operation.

Phase 5: Final Integration & Documentation
Integrate all modules, perform final testing, and prepare the project documentation.

Phase 6: Deployment & Maintenance

Deploy the completed system for practical use and perform regular maintenance, updates, and bug fixes to ensure the system remains functional, secure, and reliable.

Expected Outcome and Future Scope

Expected Outcome

The proposed system is expected to provide a centralized platform where students can easily access and manage academic and campus-related information. It will reduce the difficulty of finding notes, note reviews, notices, deadlines, career opportunities, and campus services from different sources. The system will also help administrators manage users, content, and platform activities efficiently.

Future Scope

In the future, the system can be further enhanced by introducing features such as mobile application support, real-time notifications, advanced search capabilities, and personalized recommendations. It can also be integrated with existing university systems to provide more efficient access to academic and campus-related services. Furthermore, the platform can be expanded to support multiple universities and a larger number of students.
